SUMMARY

Full-stack developer with hands-on experience building and operating live, revenue-generating SaaS products end to end. Founded and built SoftuneBD, a multi-tenant ecommerce platform serving real paying merchants in Bangladesh, and currently lead engineering on Wonderscore, an AI-visibility SaaS product used by paying customers. Comfortable owning a system solo across backend architecture, frontend, infrastructure, and production operations, with particular strength in data integrity, third-party payment and AI-provider integrations, and diagnosing live production issues from raw logs.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript

Backend: FastAPI, Node.js, Express.js, async Python (Motor, asyncpg, SQLAlchemy 2.0)

Frontend: Next.js (App Router), React, React Native, Tailwind CSS, Flutter

Databases & Infrastructure: PostgreSQL, MongoDB, Redis, RabbitMQ, Supabase, AWS (S3, EC2), Docker, systemd

AI / LLM Integration: OpenAI, Anthropic, Perplexity, and Google Gemini APIs (multi-provider orchestration)

Auth & Payments: JWT, Google OAuth, bcrypt, bKash, Nagad, SSLCommerz

Tools: Git, GitHub Actions, Postman, Prisma, Playwright, BeautifulSoup

EXPERIENCE

Lead Software Developer | Wonderscore.ai (Remote, UK) 2025 to Present

- Sole engineer across backend (FastAPI, MongoDB), frontend (Next.js, React, TypeScript), and production operations for a live AI-visibility (GEO) SaaS product that measures how accurately AI models such as ChatGPT, Claude, Perplexity, and Gemini describe and recommend a business.
- Built a two-phase scoring pipeline: a technical on-page audit (Playwright and BeautifulSoup for crawling, schema and entity extraction) and a multi-provider AI-visibility engine running categorized queries in parallel across four LLM providers, scored on mention rate, position, and citation rate.
- Ran a self-directed, evidence-based audit of the production app and used live production logs to diagnose real incidents, including root-causing a missing weekly customer email to a scheduler bug, and fixing a dashboard and public report page that both showed a “High AI Visibility” grade before any AI-visibility test had actually run for that business.
- Diagnosed a silently-failing question-generation feature by correcting backend HTTP status-code handling and rebuilding frontend error handling to surface the real cause, and separately replaced a fully mocked billing interface and a password-change flow that reported false success with correct, honest states tied to real data.

Founder & Lead Developer | SoftuneBD (Dhaka, Bangladesh) 2025 to Present

- Designed and built a multi-tenant ecommerce SaaS platform for Bangladeshi merchants, comparable in scope to Shopify but localized for the local market: native BDT pricing, bKash, Nagad, and SSLCommerz payments, Cash on Delivery, and local courier integration; live with real paying merchants and real transactions.
- Architected the system as four independently deployed services (FastAPI backend, Next.js merchant dashboard, two Next.js storefront themes) on Postgres (Supabase), Redis, and RabbitMQ, with strict tenant data isolation enforced at the ORM layer via a single scoped-query pattern and a dedicated isolation test suite; cross-tenant access returns 404 by design rather than 403.
- Integrated bKash, Nagad, and SSLCommerz payment gateways alongside a manual Cash on Delivery and bank-transfer verification flow, with money stored as integer cents and immutable, snapshot-based order history to prevent floating-point and retroactive pricing errors.
- Built real-time integrations with four Bangladeshi courier services (Steadfast, Pathao, RedX, eCourier), a rule-based fraud-detection system built from scratch, and a live no-code visual theme editor, plus a self-serve signup funnel (OTP verification, guided setup, automated provisioning) taking a merchant from signup to a live, published store with zero manual intervention.

Lead Developer | Jamil Ifat Production (Remote, UK) Jan 2024 to Present

- Architected a real-time restaurant reservation platform, achieving sub-100ms latency for data sync between the web and mobile clients, backed by a Node.js and MongoDB backend built for high concurrent connection volume.
- Built a React Native app used by restaurant owners for live order and analytics dashboards, improving day-to-day administrative efficiency, and set up automated AWS deployment pipelines to shorten release cycles.

EDUCATION

B.Sc. in Computer Science and Engineering 2022 to 2026

Bangladesh University of Business and Technology (BUBT)
